

This is the vacuum fitting that you can get from Paragon. The little side arm has 10x32 threads (don't ask me how I know). My 60 is currently set up with a vacuum advance distributor (incorrect but working nicely) and this is where I attached the vacuum line. Note the position of the vac can in the lower right photo. The distributor and plug wires have been re-indexed to allow the vacuum advance distributor to clear the manifold.
